REPAIR MANUAL

**ZF 3 M (HBW 35)
ZF 5 M (HBW 50)
ZF 10 M (HBW 100)
ZF 12 M (HBW 125) / HBW 10
ZF 15 M (HBW 150)
ZF 15 MA (HBW 150 A)
ZF 15 MIV (HBW 150 V)
ZF 25 M (HBW 250)
ZF 25 MA
ZF 30 M**

This ZF M manual has been prepared for all those who have to do with ZF-HURTH Marine reversing gearbox units of the ZF M line, including models ZF 3 M, ZF 5 M, ZF 10 M, ZF 12 M, ZF 15 M, ZF 15 MA, ZF 25 M, ZF 25 MA, ZF 30 M, ZF 15 MIV, in particular for

- power plant suppliers
- shipyards
- craft owners

The ZF M manual is intended as an aid for handling ZF M transmissions and will answer all questions that may arise in daily operation and in connection with the installation and repair of ZF M transmissions.

This manual contains:

- Technical description of the gearbox units and a number of important technical data;
- Instructions for proper installation of the gearbox in the craft;
- Explanatory notes on correct operation and maintenance;
- Detailed description of all disassembly and reassembly procedures (with drawings);
- Troubleshooting table with possible causes of trouble and the required remedial action;
- Spare parts list with stock numbers of all sparte parts;
- Explosion-View drawings showing each part with the reference numerals used in the text.

No problems will be encountered in handling, installing and operating the ZF M gearbox if the instructions in this manual are followed. Should a repair be necessary, a qualified technician will have no difficulty in doing the repair work in accordance with the detailed instructions given on the following pages.

In addition, ZF M Service Stations (distributors and dealers) are available for any repairs and for supplying the spare parts required. The manufacturer will always be glad to name the Service Station nearest to your location.

All transmission units are covered by a worldwide guarantee given by the manufacturer. The manufacturer's warranty will be subject to the condition that:

- the instructions in this manual are strictly observed in handling the transmission.
- no work is performed by persons not authorized by ZF-HURTH Marine.
- no changes or alterations of any kind are made on the transmission.

Failure to observe these points will invalidate all and any warranty claims.

Caution: never start doing any work on the transmission unless and until the engine and the propeller have come to a complete standstill.

1.7 Shaft seals	5.4 Separating the gearbox sections and removing the input and output shafts
1.8 Lubrication	5.5 Removing the shifting fork
1.9 Cooling unit	5.6 Removing the intermediate gear
2. Installation	5.7 Disassembling the input shaft
2.1 Delivery condition	5.8 Disassembling the output shaft
2.2 Transport	5.9 Disassembling the quill shaft
2.3 Removal of preservative	
2.4 Painting the gearbox	6. Reassembly
2.5 Connection of gearbox with engine	6.1 General information
2.6 Connection of gearbox with propeller	6.2 Pre-assembling the intermediate gear shaft in the gearbox section without opening
2.7 Suspension of engine-gearbox assembly in the boat	6.3 Pre-assembling the shifting fork in the gearbox section with opening
2.8 Position of gearbox in the boat	6.4 Pre-assembling the actuating lever cover plate
2.9 Operation of gearbox	6.5 Pre-assembling the gears
2.10 Cooling unit	6.6 Measuring the pre-assembled gears to determine setting value «a»
2.11 Engine-gearbox compartment	6.7 Pre-assembling the bearing shields
3. Operation	6.8 Pre-assembling the actuating members
3.1 General information	6.9 Reassembling the input shaft
3.2 Initial operation	6.10 Reassembling the output shaft
3.3 Operating temperature	6.11 Reassembling the quill shaft
3.4 Operation of gearbox	6.12 Final assembly of gearbox
3.5 Sailing or moving in tow	6.13 Measuring the gear sets of input shaft and output shaft
3.6 Lay-up periods	6.14 Mounting the actuating lever cover plate
3.7 Preparation for re-use	6.15 Mounting the cooling unit
	7. Procedure to adjust the shifting lever cover
	8. Troubleshooting
	9. Spare parts list
	10. Drawings (Explosion view)

1. Description

1.1 Brief description

ZF-HURTH Marine boat reversing gearbox units of the ZF M line are servo-automatically controlled helical gear transmissions developed for use in pleasure craft and commercial craft. The servo-operated multiple-disc clutch requires only minimum effort for shifting, making the ZF M transmission suitable for single-lever remote control via a rod linkage or shift cable.

In emergency situations the ZF M permits direct reversing at engine speed above idle rpm.

The torque capacity of the clutch is exactly rated, preventing shock loads from exceeding a predetermined value to ensure maximum protection of the engine and thus providing the effect of a safety clutch.

The transmission units are characterized by low weight and small overall dimensions. The gearbox castings are made of a high-strength, corrosion-resistant aluminium alloy, chromized for improved seawater resistance and optimum adhesion of paint.

A choice of gear ratios, a high efficiency rating and low-noise operation are other prominent features of the ZF M gearbox units.

The transmissions are immersion-lubricated. Maintenance is restricted to oil level checks (see «Maintenance», chapter 4).

The shafts are supported by heavy-duty taper roller bearings and the gearbox is designed to take the axial propeller thrust (for permissible values see «Technical data», item 1.2).

Transmission sizes are available for right-hand (RH) and left-hand (LH) rotation of the input shaft, the direction of rotation being specified as seen by an observer facing the input shaft.

In gear lever positions A, the engine shaft and the propeller shaft rotate in opposite directions, in position B in the same direction (Fig. 1).

On model ZF 15 MIV, the directions of rotation are the other way round (Fig. 2).

Engine manufacturers should note that the direction of rotation refers to an observer facing the flywheel, so that left-hand rotation of the engine corresponds to right-hand rotation of the gearbox input shaft.

1.3 Gear Casing

The oil-tight gearbox housing is made of a corrosion-resistant aluminium alloy chromized for added protection from corrosion. The gear casing is divided in a vertical plane into two equal halves. Cooling fins ensure good heat dissipation and mechanical rigidity.

The oil filter screw with dipstick and the oil drain plug are screwed into the gear casing. The filler screw is provided with a breather hole.

The actuating lever, actuating cam and cover plate are a pre-assembled unit fitted laterally to the gearbox unit.

Holes (see «Main dimensions» item 1.2 pos. c) are provided for bolting the transmission to a flywheel housing or an adapter flange.

1.4 Gear set

The transmission is equipped with case hardened helical gears made of forged low-carbon alloy steel and case hardened spiral bevel gears (V drive). The drive shaft with the drive gears are an integral unit.

The splined input shaft connecting the transmission with the engine is hardened as well.

The driven shaft (propeller side) of the transmission, with the exception of the ZF15 MIV model, is fitted with an integrally forged coupling flange.

The servo-automatic clutch system governs the direction of rotation of the input shaft, and ZF M transmission units are available for clockwise: (RH = right hand) or counterclockwise (LH = left hand) rotation.

1.5 Multiple-disc clutch and clutch operation - power train

The engine torque is applied to the input shaft (36) in the specified direction of rotation and, in shifting position A (see Main Dimensions item 1.2), via gear (44), the frictionally engaged clutch discs (51 and 52) to the external disc carrier (57) and from there via the guide sleeve (59) to the output shaft (66).

In shifting position B, the torque is transmitted from the input shaft (36) via intermediate gear (26), gear (65), clutch discs (51 and 52) to the external disc carrier (57), the guide sleeve (59) and the output shaft (66).

Function

The transmission uses a positively driven, mechanically operated multipledisc clutch system mounted on the output shaft.

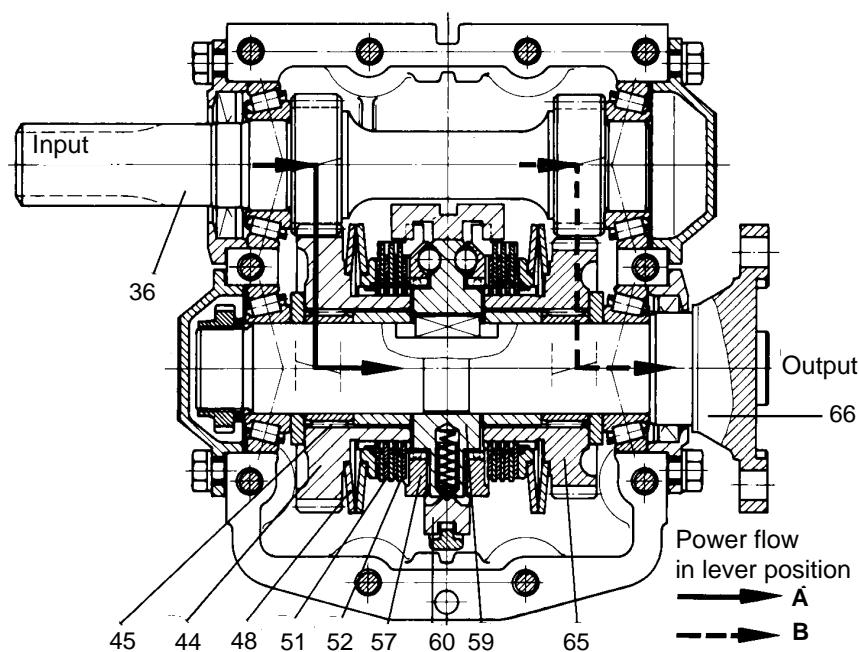

The thrust force required for obtaining positive frictional engagement between the clutch discs is provided by a servo-automatic system.

This essentially comprises a number of balls which, by the rotary movement of the external disc carrier, are urged against inclined surfaces provided in pockets between the guide sleeve and the external disc carrier and in this way exert axial pressure. The thrust force and, as a result, the transmittable friction torque are thus proportional to the input torque applied.

Due to the cup springs (48) supporting the clutch disc stack and a limitation of the range of axial travel of the external disc carrier (57), the thrust force will not exceed a predetermined value.

The actuating sleeve (60) is held in the middle position by spring-loaded pins. To initiate the shifting operation, the actuating sleeve (60) needs merely be displaced axially by the shifting fork until the arresting force has been overcome. Then the actuating sleeve (60) is moved automatically by the spring-loaded pins, while the external disc carrier which follows this movement, is rotated by frictional forces exerted by the clutch discs, and the shifting operation is completed servo-automatically as described above.

Fig. 11

1.6 Shaft bearings

Both the input and the output shafts are carried in amply dimensioned taper roller bearings.

The propeller thrust can be absorbed by the bearings (for permissible values see «Technical data», item 1.2).

The intermediate gear and the movable gears are carried in sturdy needle roller bearings.

1.7 Shaft seals

External sealing of the input and output shafts is provided by radial sealing rings. The running surfaces on the shafts are casehardened.

1.8 Lubrication

The transmissions are immersion-lubricated. The bearings are generously supplied with splash oil.

1.9 Cooling unit

Transmissions intended for use at high ambient temperatures and for continuous operation at high power (especially when shifting position B is used for the main direction of movement of the craft), must be supplied with a cooling unit (see item 2.10).

2. Installation

2.1 Delivery condition

HURTH ZF M gearbox units leave the factory in fully assembled condition. For safety reasons, the gearbox is not filled with oil for shipment. The actuating lever is mounted on the actuating shaft. On request, the gearbox is delivered with the cooling unit (see item 2.10) and flange (see item 1.2) fitted, as well as the previous damper plate between engine and gearbox.

The multi-spline shaft is provided with an oil film and protected by a plastic cap. The bright surfaces of the coupling flange on the output side are coated with an anticorrosive agent for shipment and storage. The casing is chromized and thus resistant to seawater.

Before leaving the factory, each transmission is subjected to a test run with the prescribed ATF oil. The residual oil remaining in the transmission after draining acts as a preservative and provides reliable protection against corrosion for at least 1 year if the units are properly stored.

2.2 Transport

Care should be taken when transporting the gearbox or the engine-gearbox assembly to prevent undue shocks and impacts. This applies particularly to the input and output shafts.

2.3 Removal of preservative

Use a suitable solvent for removing the anticorrosive agent, but never use emery cloth or paper, because this could damage the sealing surface and void the warranty.

It is advisable, especially after long periods of storage, to flush the transmission with the prescribed oil and remove residual oil.

2.4 Painting the gearbox

Always cover the running surfaces and sealing lips of the radial sealing rings on both shafts before painting. Make certain that the breather hole on the oil filler screw is not covered by paint. The identification plates should remain clearly legible.

Fig. 12

2.5 Connecting the gearbox with engine

Fit a recommended damping plate between the engine and the transmission to compensate for minor alignment errors and protect the input shaft from external forces and loads.

If the flywheel housing of the engine is of suitable design, the gearbox unit should be directly bolted to the housing by means of the holes provided in the gearbox.

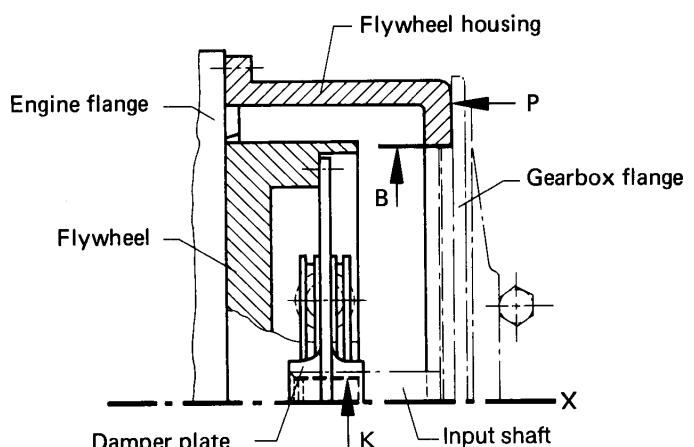

Make certain to use bolts with the right appropriate length (see «Main dimensions», item 1.2) and tighten them to the correct torque, M8 = 14 Nm (10 ft lb), M10 = 28 Nm (20 ft lb) using LOCTITE 242 or 262

An adapter flange and a damper plate are available on request for each gearbox unit (see «Main dimensions», item 1.2.10).

The radial and axial runout values shown in the drawing Fig. 12 should never be exceeded between the engine and transmission.

The input shaft end is provided with a multi-spline or involute spline profile (see «Main dimensions», item 1.2).

Connection of gearbox with engine

**Permissible radial and axial runout
(0.1 mm = 0.004 inches)**

X : B = 0,1 mm X : K = 0,1 mm X : P = 0,1 mm

2.6 Connection of gearbox with propeller

We recommend a flexible connection between the gearbox and the propeller shaft, when the engine is flexibly mounted, in order to compensate for angular deflections. The installation of a special propeller thrust bearing is not required, since the propeller thrust will be taken by the transmission bearing, provided the value specified under «Technical data», item 1.2, is not exceeded. However, the output shaft should be protected from additional loads. Special care should be taken to prevent torsional vibration. When using a universal joint shaft, make certain to observe the manufacturer's instructions.

2.7 Suspension of engine-gearbox assembly in the boat

Special care should be taken to protect the gearbox from detrimental stresses and loads when the engine-transmission assembly is not elastically suspended in the boat or craft.

The gearbox should be conveniently accessible for maintenance. If the oil drain plug of the gearbox is not accessible, the oil will have to be sucked off.

2.8 Position of gearbox in the boat

The inclination of the gearbox unit in the direction of the shafts should not exceed an installation angle of 20 degrees (see Fig.13) and 15° for ZF 15 MIV.

2.9 Operation of gearbox

The gearbox is suitable for single lever remote control. Upon loosening the retaining screw (7), the actuating lever (6) can be moved to any position required for the control elements (cable or rod linkage). (Fig. 14).

IMPORTANT

Make certain that the lever does not contact the actuating lever cover plate (9): the minimum distance between lever and cover must be 0.5 mm.

The control cable should be perpendicular to the actuating lever in the neutral position of the lever.

The zero position of the operating lever on the control console must coincide with the zero position of the actuating lever on the gearbox.

The shifting travel, as measured at the pivot point of the actuating lever, between the neutral position and end positions A and B must be at least 35 mm for the outer and 30 mm for the inner pivot point.

A larger amount of lever travel is in no way detrimental.

IMPORTANT

However, if the lever travel is shorter, proper gear engagement might be impeded which, in turn, would mean premature wear, excessive heat generation and resulting damage.

The position of the cover plate underneath the actuating lever is factory-adjusted to ensure equal lever travel from neutral position A and B.

IMPORTANT

If this cover is removed in exceptional cases, proceed as described under item 6.14 of this manual.

When installing the gearbox, make certain that shifting is not impeded by restricted movability of the cable, by unsuitably positioned guide sheaves, too small bending radius, etc.

Fig. 14

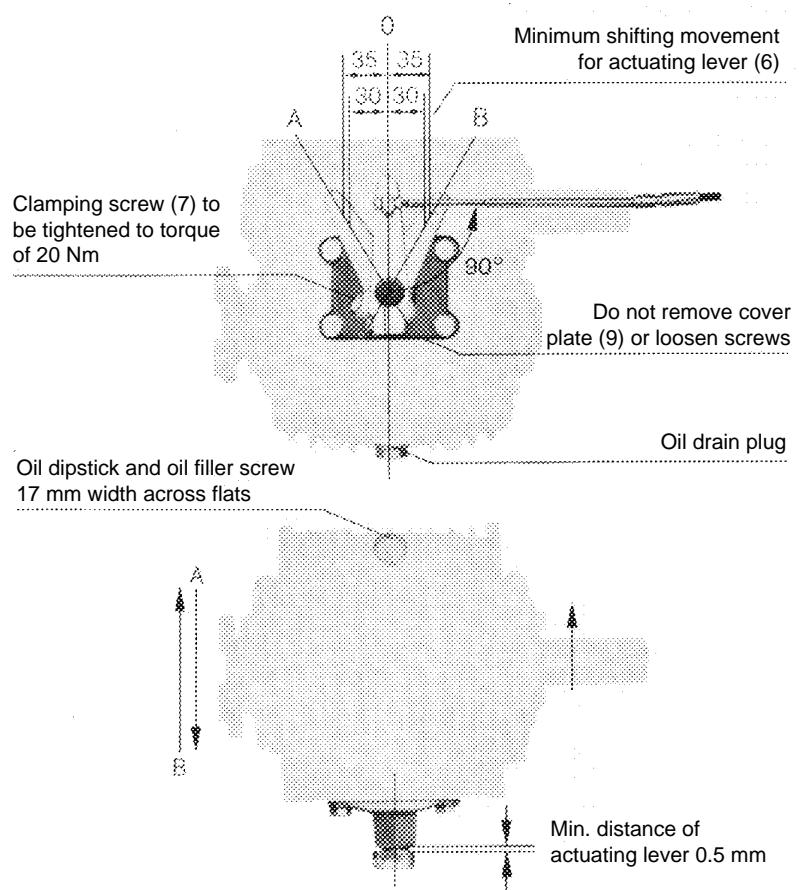

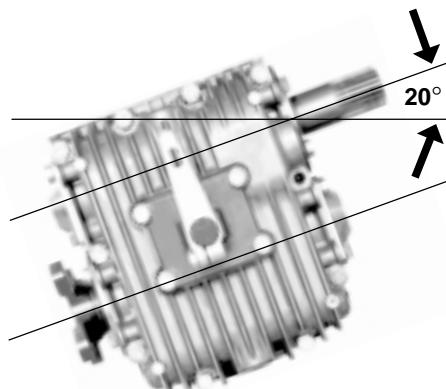

Fig. 13

2.10 Cooling unit

The arrangement of the cooling unit for the ZF 10 M, ZF 12 M, ZF 15 M, ZF 15 MA, ZF 15 MIV, ZF 25 M and 25 MA (no cooling is required for ZF 3 M and 5 M) can be seen from Fig.15.

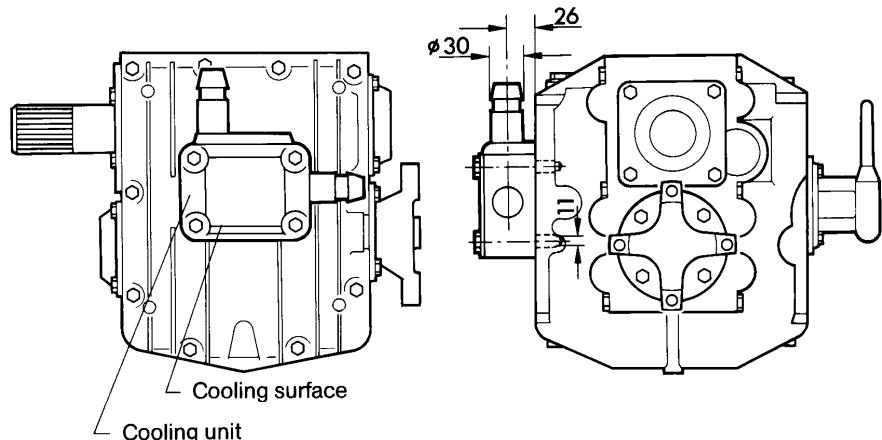

The table below shows the maximum power output in continuous operation (lever position A and B) usable without cooling. When these values are exceeded, a cooling unit is required.

The cooling unit should be connected to the fresh-water pressure line (external circuit) of the engine in accordance with Fig.16. The minimum volume of flow is 10 ltr/min. Retrofitting of the cooling unit involves no problems (see item 6.15).

2.11 Engine-gearbox compartment

Care should be taken that the engine gearbox compartment is properly ventilated.

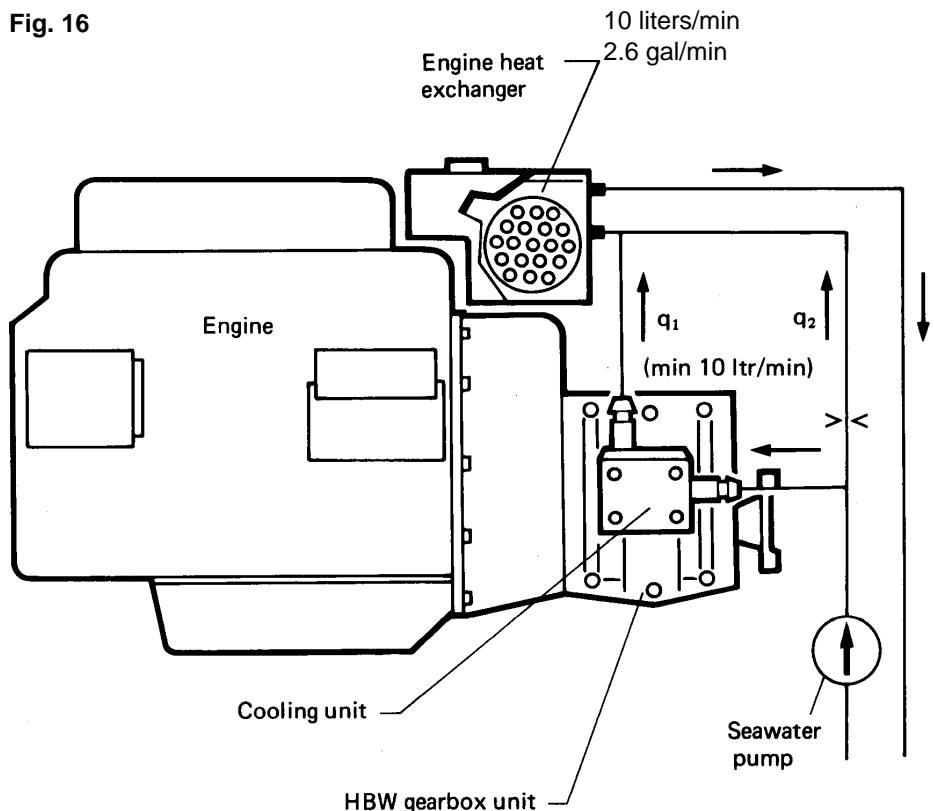

Fig. 15

Max. engine power usable without cooling

Lever position	ZF 3 M ZF 5 M	ZF 10 M	ZF 12 M ZF 15 M ZF 15 MA	ZF 15 MIV	ZF 25 M ZF 25 MA
A	no cooling	no cooling	40 kW 54 hp	25 kW 34 hp	40 kW 54 hp
B	no cooling	25 kW 34 hp	25 kW 34 hp	20 kW 34 hp	always with cooling unit

Fig. 16

3. Operation

3.1 General information

All ZF M boat reversing gearbox units are test-run on a test stand at the factory prior to delivery.

For safety reasons, the oil is drained before shipment.

3.2 Initial operation

Fill the gearbox with oil (ATF), (see 4.7 or recommended fluids). The oil level should be up to the index mark on the dipstick (see fig. 17).

To check the oil level, just insert the dipstick, do not screw in. Retighten the hex screw with the dipstick after the oil level check. Do not forget sealing ring.

3.3 Operating temperature

Normal operating temperature of the transmission oil should be in the range of 50°C (122°F) to 80°C (176°F). Max. permissible ATF temperature of 100°C (212°F) may only be reached for a short time.

3.4 Operation of gearbox

The zero position of the operating lever on the control console must coincide with the zero position of the actuating lever on the transmission. Shifting is initiated by a cable or rod linkage via the shifting lever and an actuating cam. The

completion of the gear changing operation is servo-automatically controlled.

Gear changing should be smooth, not too slow, and continuous (without interruption). Direct changes from forward to reverse are permissible, since the multiple-disc clutch permits gear changing at high rpm, including sudden reversing at top speeds in the event of danger.

3.5 Sailing or moving in tow

Rotation of the propeller while the boat is sailing, being towed, or anchored in a river, as well as operation of the engine with the propeller stopped (for charging the battery), will have no detrimental effects on the gearbox.

IMPORTANT

When the boat is sailing (engine stopped), the gear lever must be in zero position. Never put the gear lever in the position corresponding to the direction of travel of the boat.

Locking the propeller shaft by an additional brake is not required: use the gear lever position opposite your direction of travel for this purpose.

3.6 Lay-up periods

If the transmission is not used for periods of more than 1 year it should be completely filled with oil of the same grade to prevent corrosion. Protect the input shaft and the output flange by means of an anticorrosive coating if required.

3.7 Preparation for re-use

See item 2.3

4. Maintenance

4.1 Transmission oil

To ensure trouble-free operation of the clutch only use Automatic Transmission Fluid (ATF).

4.2 Oil quantity

ZF 3 M	0.30 ltr	0.32 qts
ZF 5 M	0.30 ltr	0.32 qts
ZF 10 M	0,35 ltr	0.37 qts
ZF 12 M	0.56 ltr	0.59 qts
ZF 15 M	0.56 ltr	0.59 qts
ZF 15 MA	0.47 ltr	0.50 qts
ZF 15 MIV	1.00 ltr	1.06 qts
ZF 25 M	0.75 ltr	0.79 qts
ZF 25 MA	0.75 ltr	0.79 qts
ZF 30 M	min. 0.90 ltr max. 1.10 ltr	min. 0.95 qts max. 1.17 qts

Use the index mark on the dipstick as a reference (see item 3.2)

4.3 Oil level checks

Check the oil level in the gearbox about once a month. Correct oil level: index mark on dipstick (see item 3.2). Always use the same oil grade when topping up. Don't overfill the gearbox. This will create higher operating temperatures.

4.4 Oil change

Change the oil the first time after about 25 hours of operation, then at intervals of at least 1 year.

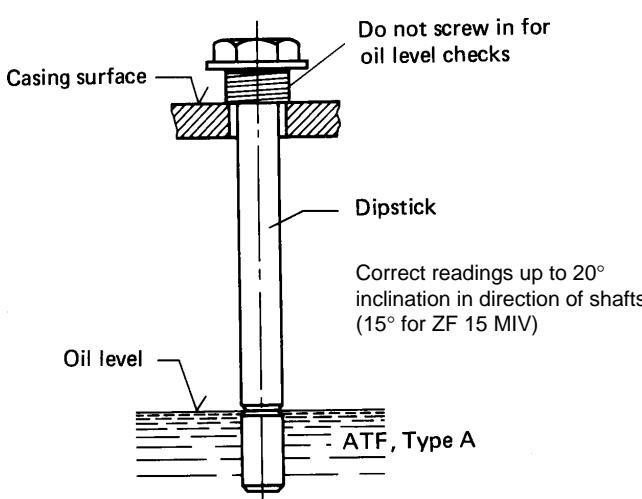

4.5 Checking the control cable linkage

The control cable or rod linkage should be checked at shorter time intervals. Check the zero position of the operating lever (on the control console) and of the shifting lever (on the gearbox) on this occasion. The minimum lever travel from the neutral position to operating positions (0-A = 0-B) should be 35 mm (1.38 in) for the outer and 30 mm (1.18 in) for the inner pivot point. Make certain that these minimum values are safely reached. Check the cable for easy movability (see item 2.9).

4.6 Cooling

If the transmission is equipped with a cooling unit, drain the cooling water before long periods of non-use when temperature is below freezing point.

5. Disassembly

Note: fold out illustration sheets 1 and 2 or (for ZF 15 MIV) sheets 3 and 4 (exploded views) for reference.

5.1 Removing the cooling unit (if present)

Unscrew 4 hex head screws M8x50 and take off unit (see illustration under item 6.14.2).

5.2 Removing and disassembling the actuating lever cover plate

5.2.1 Always set actuating lever to neutral position.

5.2.2 Remove hex nuts (22) from cover plate (9), using 13 mm spanner (wrench), and take off spring washers (4).

5.2.3 Remove cover plate assembly (12), lever (6) and actuating cam (11).

5.2.4 Remove screw (7) from lever (6). Pull off lever (6). Remove actuating cam (11) and needle bearing (70) only in models ZF 12 M - 15 M - 25 M - 30 M. Remove actuating cam sealing ring (8).

5.3 Removing the bearing shields

5.3.1 Remove hex head screw (5) from bearing shields (2) and (3), using 13 mm spanner (wrench), and take off spring washers (4).

5.3.2 Remove cover (3) and bearing shield (2) on input shaft (36) together with seals (28).

5.4 Separating the gearbox sections and removing the input and output shafts

5.4.1 Remove hex nuts (22) from gearbox (1), using 13 mm spanner (wrench), take off spring washers (4) and remove screws (21).

5.4.2 Separate the two halves of gearbox (1) by light hammer blows on the oil filler screw and oil drain plug (19 and 20).

5.4.3 Remove shims (37, 38, 39, 40) from the input and output shafts and keep separately. For proper reassembly it is advisable to note down the thickness and location of each of the shims to obtain the correct bearing play. If none of the parts (2, 3, 32, 33, 36) on the input shaft and of the parts (2, 3, 34, 35, 43, 46, 47, 59) of the output shaft are replaced, the shims can be re-used in the same positions. When any of these parts are replaced, the dimensions of the gear set relative to the casing have to be measured anew and suitable shims have to be installed.

5.5. Removing the shifting fork (15)

5.5.1 Remove screw plug (17) (not necessary in ZF 3 M - 5 M since there is no plug but only a O-ring).

5.5.2 Pull actuating shaft (16) out of the hole in the half housing.

5.5.3 Remove shifting fork (15).

5.6 Removing the intermediate gear (26)

5.6.1 Heat gearbox section with intermediate gear to a temperature of approx. 80°C (176 F); in ZF 3 M - 5 M only, first remove the retaining ring (23).

5.6.2 Knock pin (24) out of its bearing by light hammer blows, using a driving pin of suitable size.

5.6.3 Remove intermediate gear (26), retaining plates (25) and roller cage (27).

5.7 Disassembling the input shaft (36)

5.7.1 Remove outer bearing races (32).

5.7.2 In the event of bearing damage, cautiously drive inner races (33) off the input shaft (36) with a punch (away from gear).

5.8 Disassembling the output shaft (66)

5.8.1 Mount support rail on a vice with the pins pointing upwards (not on ZF 15 MIV).

5.8.2 Place output shaft (66) vertically on the support rail with the flange side down.

5.8.3 Remove screw (41) spacer (42) and outer bearing race (34).

Only in models ZF 3 M - 5 M remove also shims (68) and in model ZF 15 MA spacer (68).

5.8.4 Place side of gear (65) adjacent to shaft flange against a suitable support (a divided flange or two brackets of suitable section) and use pin of suitable size to press off the output shaft. Do not place the support neither against the gear's (65) teeth nor against the friction washer (43). But place it as shown on the drawing below.

The parts removed from the upside of the shaft are not interchangeable with the parts removed from the flange side. Keep separately.

5.8.5 Remove keys (67) from the output shaft and keep in a separate place (1 key for ZF 3 M and 5 M, 2 keys for ZF 10 M, 12 M, 15 M, 15 MA, and 4 keys for ZF 25 M, 25 MA and ZF 30 M).

Fig. 18

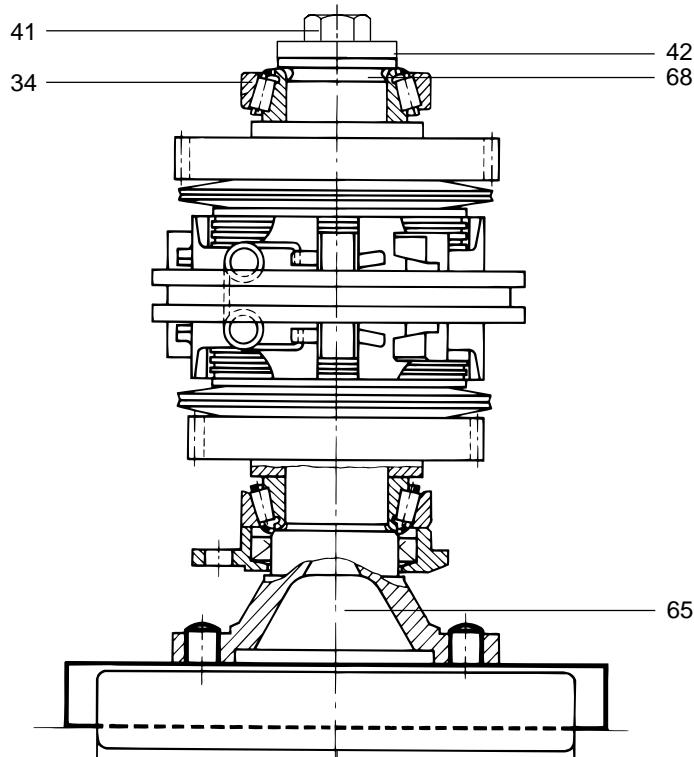

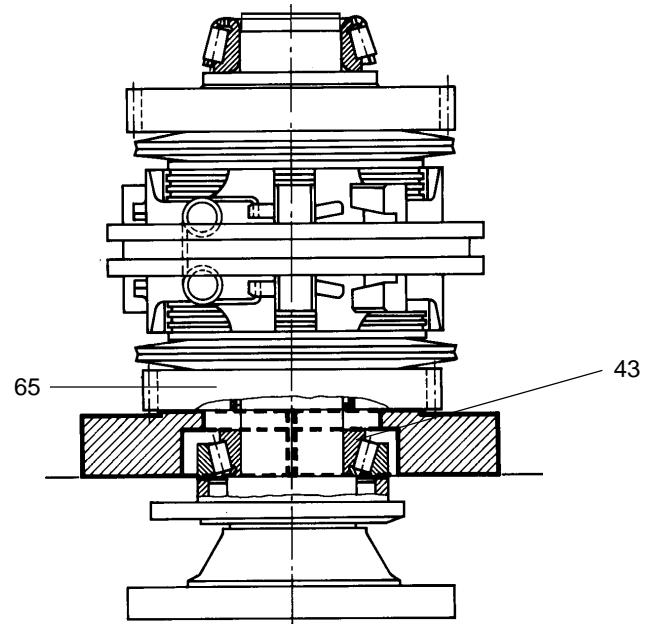

Fig. 19

5.8.6 Put off shims (53, 54, 55, 56), spacer (47) and needle bearing (45) from the output shaft.

5.8.7 Attach divided flange to face side of bearing shield (2) and pull off thrust washer (43), inner race (46) and taper roller bearing (34, 35) with shield. On ZF 15 MIV only pull off taper roller bearing (34, 35).

5.8.8 Remove internal and external clutch discs from gears (44) and (65).

5.8.9 Dismantling the gears

Compress cup springs (48) (only one each side for ZF 3 M - 5 M) by means of dismantling tool. Remove circlip (50) and take off thrust plate (49).

5.8.10 Dismantling the actuating members.

Detach springs (64), watching for balls (58).

5.8.11 Remove disc carrier (57).

5.8.12 Place actuating sleeve (60) on a plane surface and press out guide sleeve (59). Watch for detent pins and springs jumping off the guide sleeve. It will be advisable to wrap a rag around the actuating sleeve (60) and the guide sleeve (59) to catch any parts that might jump off.

5.9 Disassembling the quill shaft (ZF 15 MIV).

Note: see drawing page 38.

5.9.1 Remove grooved ring nut (83) by means of socket spanner and take off ring (34) with sealing ring (31).

5.9.2 Place divided flange against face side of bevel gear (80) and force bevel gear (80) spacer ring (76) and bearing (74) off quill shaft.

5.9.3 Remove key (81) and spacer ring (76).

5.9.4 Force off bearing (74) by means of divided flange.

Fig. 20

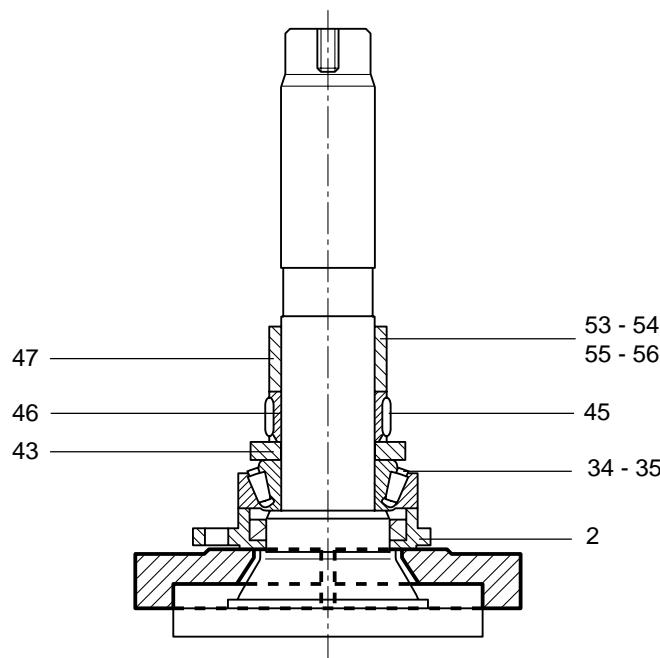

Fig. 22

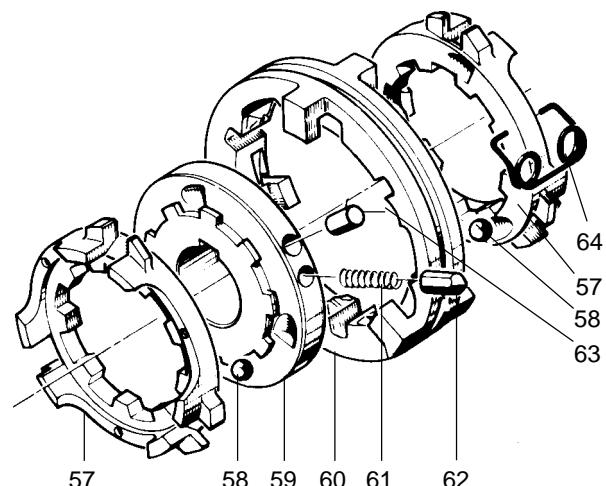

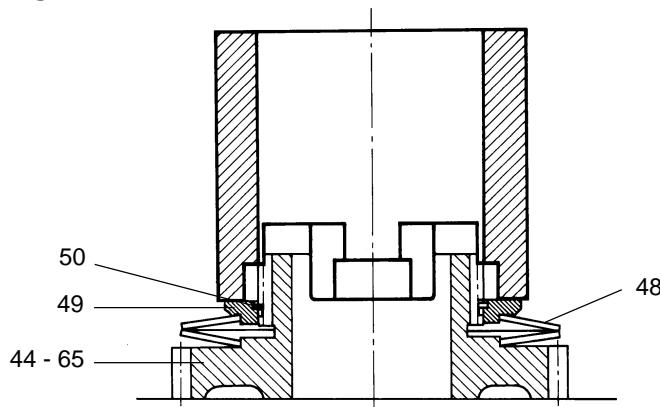

Fig. 21

6. Reassembly

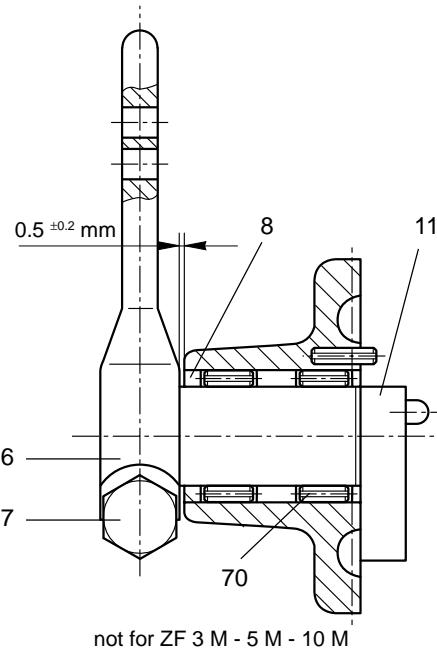

Note: fold out illustration sheets 1 and 2 (exploded views) for reference. For ZF 15 MIV use illustration sheets 3 and 4.

6.1 General information

The following points should be observed when reassembling the gearbox:

- Clean all parts thoroughly, especially sealing surfaces, inspect for wear, damage and cracks, and replace if required.
- Check shifting fork (15) for wear. The contact surfaces of this fork are provided with amolybdenum coating. Should this coating be worn away at any point, replace the shifting fork. Max wear on guiding surfaces 0.2 mm (0.008 in) on each side.
- Thrust rings (43) require replacement if wear exceeds 0.25 mm (0.0098 in).
- Internal discs (51) have a sintered metal coating of 0.3 mm (0.012 in) on each side. If the surface structure (after cleaning) shows indications of wear, replace the discs.
- Apply thin coat of oil to antifriction bearings before installation.

Fig. 23

6.2 Assembling the intermediate gear shaft in gearbox section side cooler

- 6.2.1** Insert retaining plate (25).

IMPORTANT:

Note that the bevelled corners of retaining plates (25) have to be placed in different positions (see illustration on sheet 1).

- 6.2.2** Insert needle cage (27) into intermediate gear (26) and place complete assembly with retaining plate (25).

- 6.2.3** Insert second retaining plate (25). Not for ZF 3 M - 5 M.

- 6.2.4** Fit O-ring (23) to intermediate gear shaft (24)* and drive it into gearbox section by knocking slightly on a drive pin.

* on ZF 3 M - 5 M insert intermediate gear shaft with seeger 23 and Loctite 574.

* on ZF 25 M - 25 MA and ZF 30 M, insert intermediate gear shaft (24) without O-ring (23) and close bore in gearbox section with sealing compound by pressing in a plug (23) with Loctite 574. (see illustration on sheet 1).

* on ZF 15 MIV insert intermediate shaft (24) and stop it in its place by knocking with a driver pin on the edge of the hole of the housing. Close the outsider hole in the housing by pressing in plug (23) with Loctite 574.

6.3 Assembling the shifting fork in gearbox section side shifting cover

- 6.3.1** Insert shifting fork (15) into gearbox section (1) side the actuating lever in such a way that the long arm of the fork points downwards.

- 6.3.2** Insert shifting rod (16) through bores in gearbox and shifting fork.

- 6.3.3** Fit screw plug (17) to gearbox, making certain that the clearance between shifting rod (16) and screw plug (17) is min. 0.5 mm (0.02 in).

Seal screw plug with Loctite 242 (ZF 3 M - 5 M only O-Ring).

- 6.3.4** Check shifting fork for easy movability.

6.4 Pre-assembling the actuating lever cover plate

Use punch tool to press sealing ring (8) into cover plate (9). Spread antifriction bearing grease between sealing lips.

- 6.4.1** Insert actuating cam assembly (11) into cover plate (9).

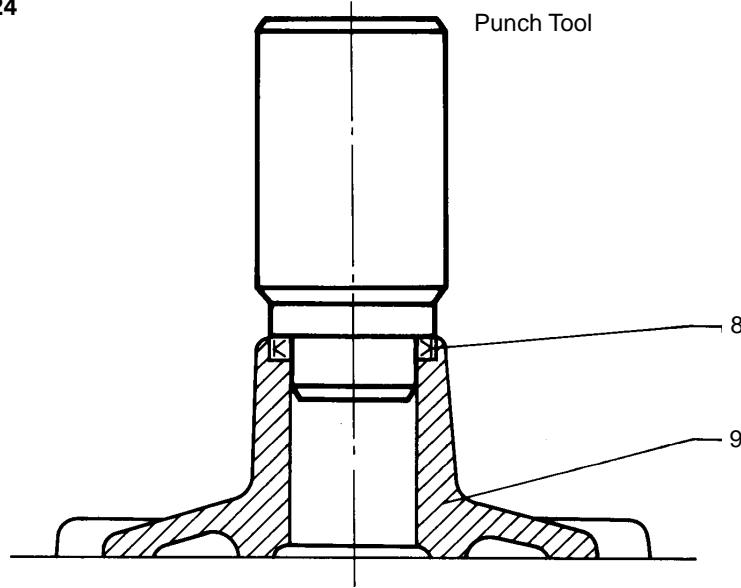

- 6.4.2** Fit actuating lever (6).

IMPORTANT:

Clearance between actuating lever and cover plate 0.5 mm (0.02 in).

- 6.4.3** Clamp actuating lever by means of retaining screw (7), using a 13 mm spanner (wrench). Screw in with torque of 20 Nm.

Fig. 24

6.5 Pre-assembling the gears (65) and (44) with cup springs (48) and clutch discs (51 and 52)

IMPORTANT:

If previously disassembled parts are used, make certain that only mating and associated parts are reassembled.

6.5.1 Join two cup springs (48) (only one cup spring for ZF 3 M - 5 M) face to face (external diameters in contact) and place them on the centering collar of gears (65) and (44).

6.5.2 Place thrust ring (49) on cup springs.

6.5.3 Place circlip (50) on gear hub and use mounting tool and press to fit circlip into groove on hub. Don't press completely the cup springs and be sure that the tool presses at least on three points on the thrust washer (49).

6.5.4 Attach clutch discs (51 and 52), first internal disc (51), then alternatively external disc (52), internal disc (51), etc.

6.6 Measuring the pre-assembled gears (65) and (44) to determine setting value «a».

If no parts had to be replaced, the previously disassembled shims (53, 54, 55, 56) can be re-used in their former arrangement and positions without any measuring operation.

If measuring is required, proceed as follows:

6.6.1 Place pre-assembled gear (65), and subsequently gear (44) on thrust washer (43), (end face of hub downwards, see illustration).

IMPORTANT:

On ZF 3 M - 5 M - 10 M there is a step on the thrust washer (43). Put the side of the washer with the step against the gear. Be sure that the needle bearing inner race (46) is fitted into it.

6.6.2 Insert needle cage (45), inner race (46) and spacer (47) into bore of gear.

6.6.3 Fit shims (53, 54, 55, 56), as required, until prescribed setting value «a» is obtained (see illustration).

6.6.4 Shims are available in thicknesses of 0.4 - 0.5 - 0.6 and 0.7 mm.
(0.016 - 0.020 - 0.024 and 0.028 in)

Setting value «a»

Type	mm	inches
ZF 3 M	8.0±0.1	0.315±0.004
ZF 5 M		
ZF 10 M	13.0±0.1	0.512±0.004
HBW 10		
ZF 12 M		
ZF 15 M	12.4±0.1	0.488±0.004
ZF 15 MA		
ZF 15 MIV		
ZF 25 M / 25 MA	16.2±0.1	0.638±0.004
ZF 30 M	19.75±0.1	0.778±0.004
Old versions (4+3 external clutch discs)		
HBW 10 (versions from 01 to 08)	13.2±0.1	0.520±0.004
HBW 150 (versions from 09 to 14)		
HBW 150 V (versions from 01 to 07)		

Fig. 25

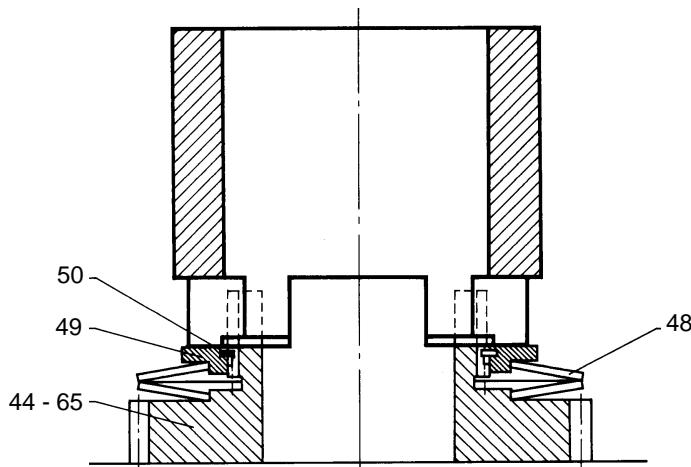

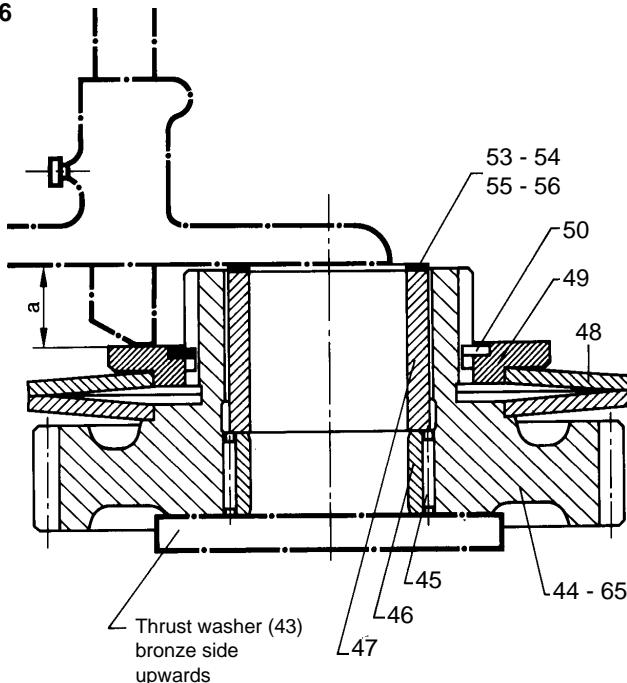

Fig. 26

6.7 Pre-assembling the bearing shields (2) for the input and output shafts

Use a driver tool to press sealing rings (30 - input and 31 - output) into shield (2).

6.8 Pre-assembling the clutch members

6.8.1 Fit driving pins (63), springs (61) and detent pins (62) to guide sleeve (59).

6.8.2 Place actuating sleeve (60) on plane press surface.

6.8.3 Place guide sleeve (59) on top of actuating sleeve (60) with the three driving pins (63) in alignment with the three grooves in the actuating sleeve. Watch for correct position of detent pins (62) relative to angular pockets of sleeve.

6.8.4 Press guide sleeve (59) into actuating sleeve (60) up to midway position (noticeable click).

6.8.5 Insert balls (58) into ball pockets of guide sleeve, attach disc carrier (57), turn upside down then fit balls in opposite face side and attach second disc carrier (57).

6.8.6 Attach springs (64) with closed part of spring windings pointing outwards.

6.9 Reassembling the input shaft

Preheat inner races (33) of taper roller bearings to a temperature of 100° C (212F) and, using tubular or punch tool, press races on input shaft (36) on both sides.

IMPORTANT:

Repress after cooling down, so that no gap is left.

Fig. 27

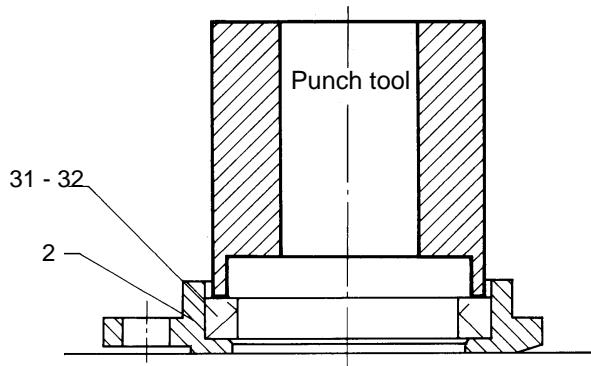

Fig. 28

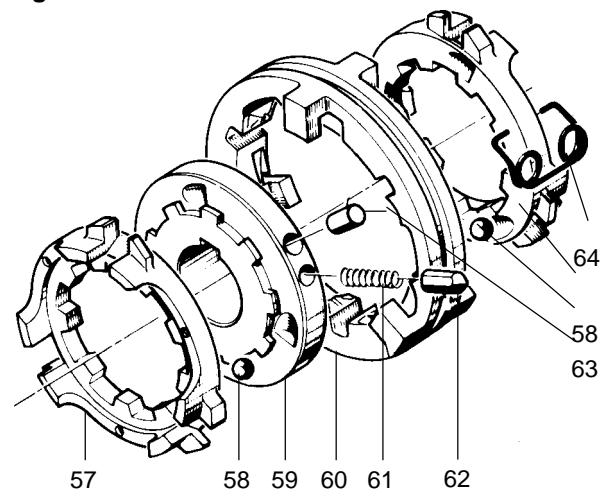

Fig. 29

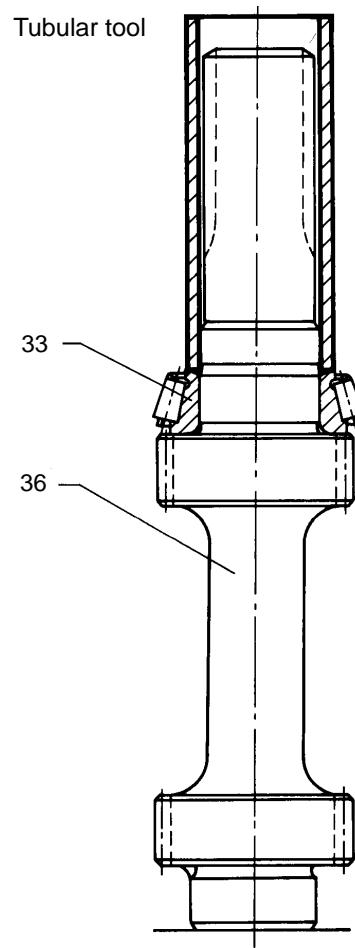

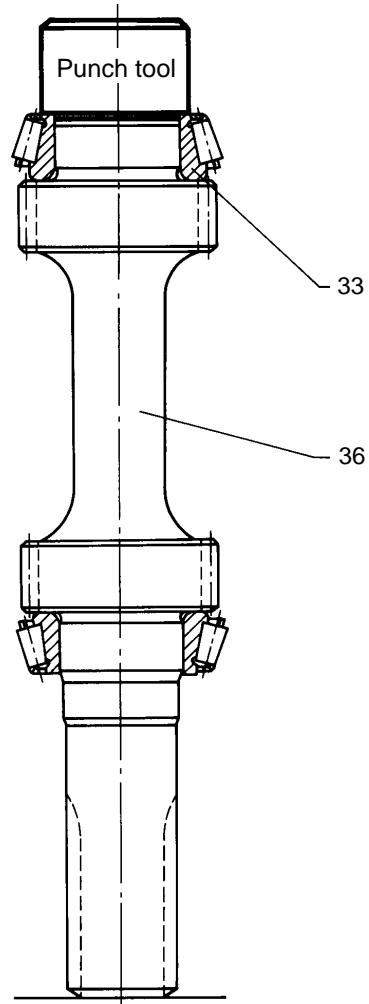

Fig. 30

6.10 Reassembling the output shaft

6.10.1 Place pre-assembled bearing shield (item 6.7) with seal (28) on output shaft (66) (not applicable to ZF 15 MIV).

6.10.2 Attach outer race (34) of taper roller bearing.

6.10.3 Pre-heat inner race (35) of taper roller bearing to a temperature of approx. 100°C (212 F) and press on output shaft (66) in hot condition.

On ZF 15 MIV press complete bearing (68) on shaft (66).

IMPORTANT:

Repress after cooling down, so that no gap is left.

6.10.4 Fit thrust ring (43) in such a way that sintered surface (brown colour) faces gear.

6.10.5 Use tubular tool to press on inner race (46) of needle bearing for gear (65).

6.10.6 Attach needle cages (45) and completely pre-assembled gear (65) with clutch discs (51 and 52).

6.10.7 Fit spacer (47) and shims (53, 54, 55, 56) to gear (65).

6.10.8 Fit keys (67) to shaft (1 for ZF 3 M, 5 M, 2 keys for 10 M, 12 M, 15 M, 15 MA, 4 for ZF 25 M - 25 MA and ZF 30 M).

6.10.9 Press pre-assembled actuating members (see item 6.8) on output shaft (66).

IMPORTANT:

Align keys radially relative to guide sleeve (59).

Fig. 31

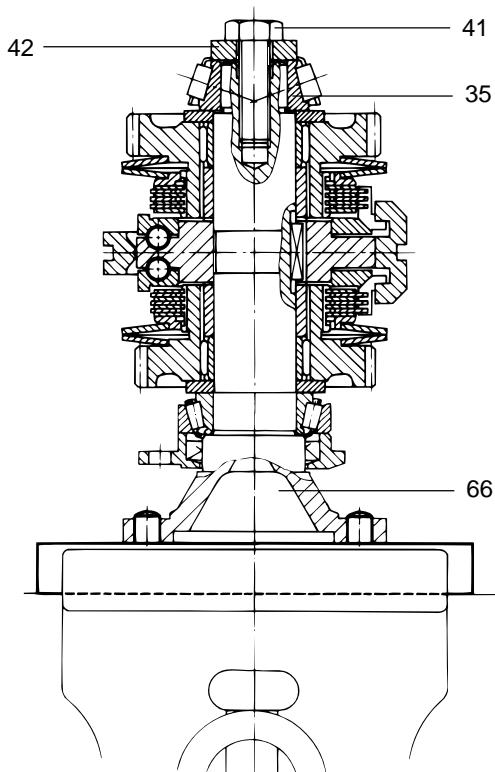

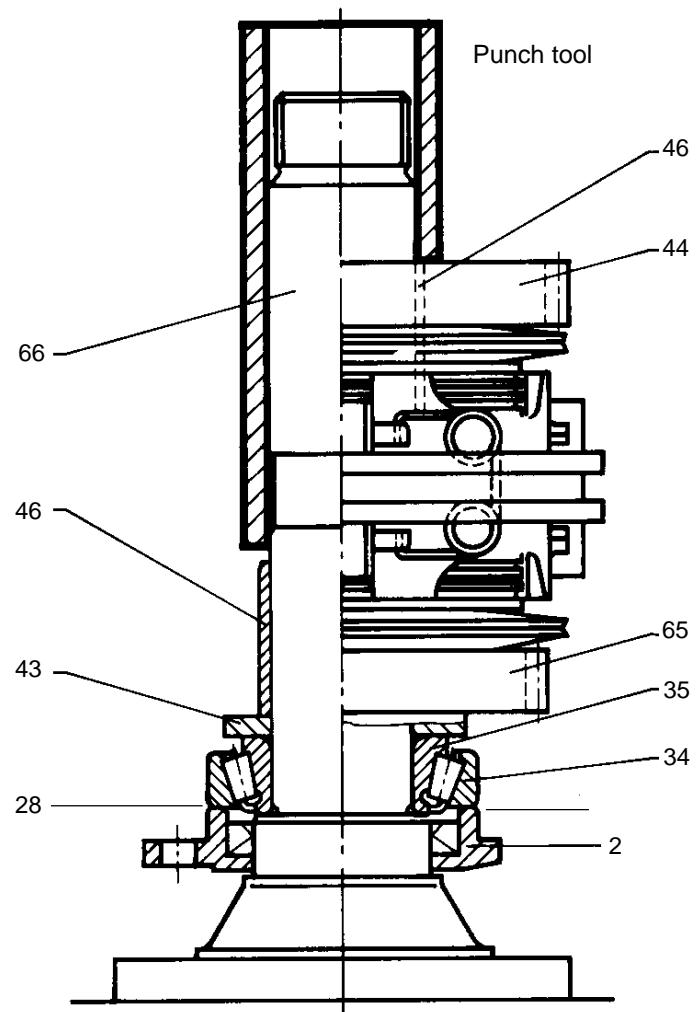

Fig. 32

6.10.10 Attach shims (53,54,55, 56) to gear (44).

6.10.11 Attach spacer (47) to gear (44).

6.10.12 Use tubular tool to press on inner race (46) of needle bearing for gear (44).

6.10.13 Attach pre-assembled gear (44) with needle cage (45) and clutch discs (51 and 52).

Align external discs for proper engagement with actuating member.

6.10.14 Attach thrust ring (43) in such a way that sintered surface (brown colour) faces gear.

6.10.15 Pre-heat inner race (35) of taper roller bearing to a temperature of approx. 100°C (212 F) and press it on shaft.

IMPORTANT:

Repress after cooling down, so that no gap is left.

6.10.16 Screw on bolt (41), (supplied with Loctite) and tighten to torque:

ZF 3 M - 5 M	50 Nm	37 ft lb
ZF 10 M	60 Nm	44 ft lb
ZF 12 M - 15 M	100 Nm	74 ft lb
ZF 15 MA - 15 MIV	100 Nm	74 ft lb
ZF 25 M - 25 MA	120 Nm	89 ft lb
ZF 30 M	120 Nm	89 ft lb

6.10.17 (ZF 3 M, ZF 5 M only) attach shims (68) to end shaft (66). The gap has to be 0.2 ± 0.05 mm (0.0079 ± 0.0019 in).

6.10.18 (ZF 15 MA only) attach spacer (68).

6.10.19 Check gears (44) and (65) for free movability in an axial direction.

6.10.20 Attach outer race (34) of taper roller bearing.

**6.11 Reassembling the quill shaft
ZF 15 MIV**

6.11.1 Fit radial sealing ring (31) and clip (84) together with O-ring (86).

6.11.2 First bearing:
Press on bearing inner race (74).
Fit bearing outer race (75).

6.11.3 Fit spacer ring (76).

6.11.4 Fit key (81).

6.11.5 Press on gear (80).

6.11.6 Fit second spacer ring (76).

6.11.7 Second bearing:
Press on inner race (74).
Fit outer race (75).

6.11.8 Push on clip (73) together with O-ring (85).

6.11.9 Tighten grooved ring nut (83) to a torque of 95 Nm (70 lbf), using a socket spanner, and then secure by pressing rim into groove in shaft.

6.11.10 Fit radial sealing ring (31) and cup (84) together with O-Ring (86).

Fig. 33

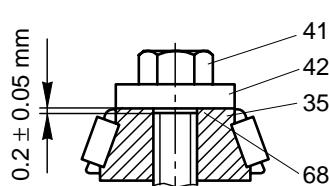

Fig. 34

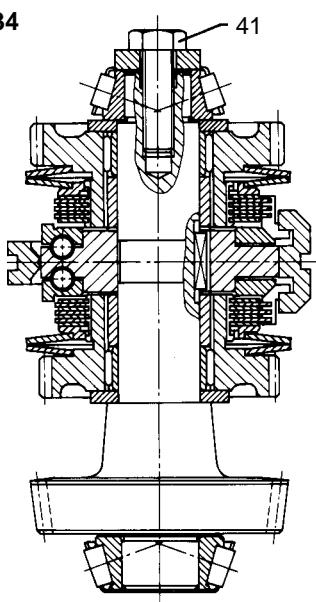

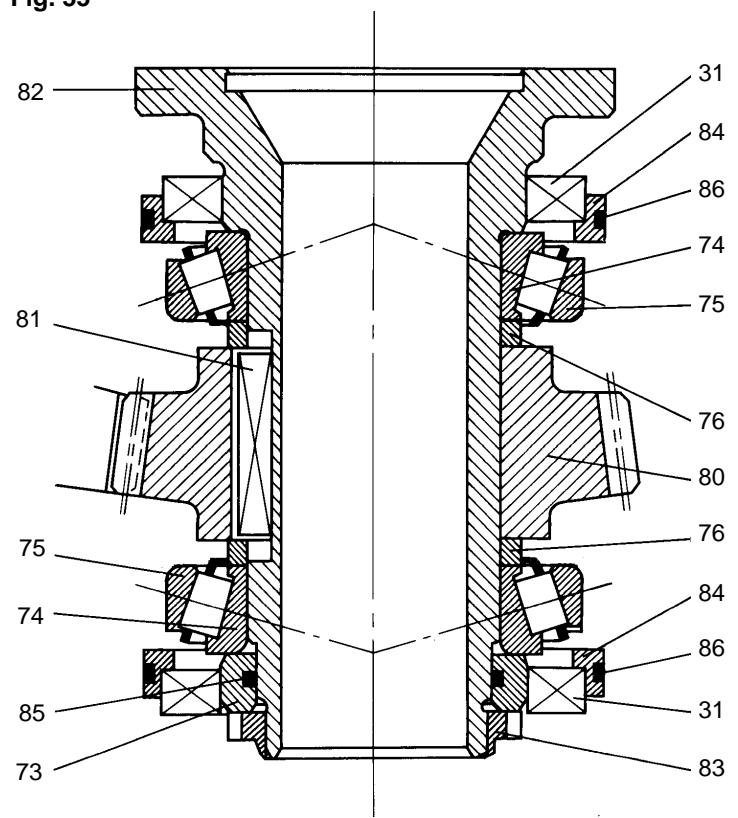

Fig. 35

6.12 Final assembly of gearbox

6.12.1 Place pre-assembled gearbox section (1) - (with intermediate gear) - on side wall.

6.12.2 Place pre-assembled output shaft (66) in lower part of gearbox with flange side towards intermediate gear side (on ZF 15 MIV, bevel gear towards intermediate gear side).

6.12.3 Place pre-assembled input shaft (36) in upper part of gearbox.

6.12.4 (ZF 15 MIV only) Place pre-assembled quill shaft (73) in lower part of gearbox (watching to correct engagement of marked teeth).

Add shims 78 on quill shaft:

1.2 mm on side input shaft and 2.2 mm on side output flange.

Add shims (70) on clutch shaft 2 x 0.1 mm on side output flange.

6.12.5 (ZF 15 MIV only) Check backlash 0.08 to 0.13 mm (0.003 to 0.005 in). Between teeth of bevel gears using a dial indicator in contact with tooth surface.

To correct backlash:

Replace shim 78 side output flange with a thicker one to decrease backlash and vice-versa.

If the correction is not enough to reach the correct backlash, modify shimming (70) on clutch shaft side output flange and repeat procedure.

To correct axial play (quill shaft):

Check axial play 0.05 ± 0.02 mm (0.002 ± 0.0008 in).

Compensate for difference by inserting shims (78) side input shaft.

6.12.6 Seal with LOCTITE 574 surface of pre-assembled gearbox section (1) (with shifting fork) and place upper section on lower section of gearbox.

6.12.7 Insert screws (21) preferably in the middle, and screw in low-tight to secure the two gearbox sections together.

6.12.8 Use a plastic hammer to align the two gearbox section (1) by tapping them gently into position.

6.12.9 Fit bearing shield (2) with gasket (28) to output shaft (66) by means of spring washers (4) and screws (5), using a 13 mm spanner (wrench).

Tighten to torque of 14 Nm (10 ft lb).

6.12.10 Slide pre-assembled bearing shield (2) with gasket (28) over input shaft and secure by means of spring washer (4) and screws (5), using a 13 mm spanner (wrench).

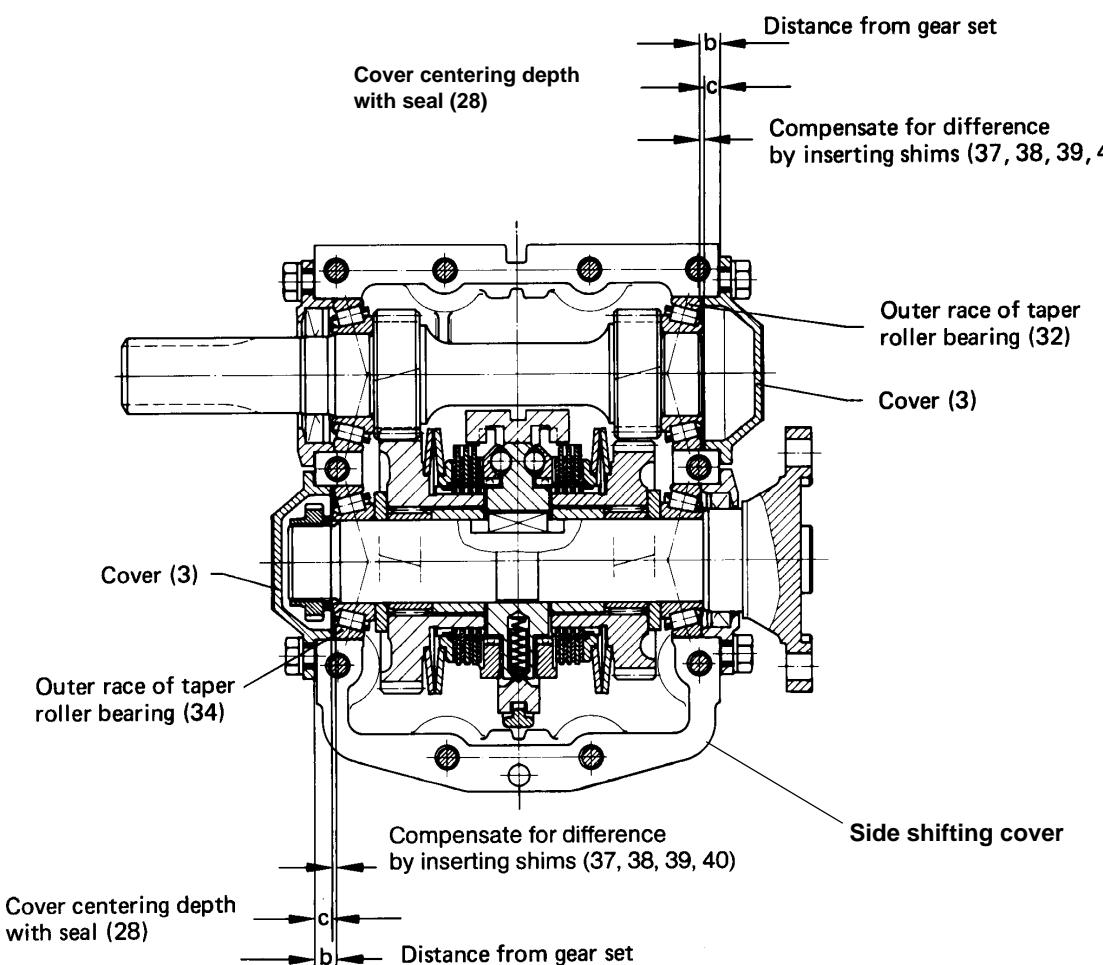

Tighten to torque of 14 Nm (10 ft lb).

6.13 Measuring the gears sets of input shaft and output shaft (see illustration)

6.13.1 Tap outer races (32) and (34) on output and input shafts to eliminate bearing play, simultaneously rotating the shafts.

6.13.2 Determine dimension «b» by means of depth gauge (see illustration).

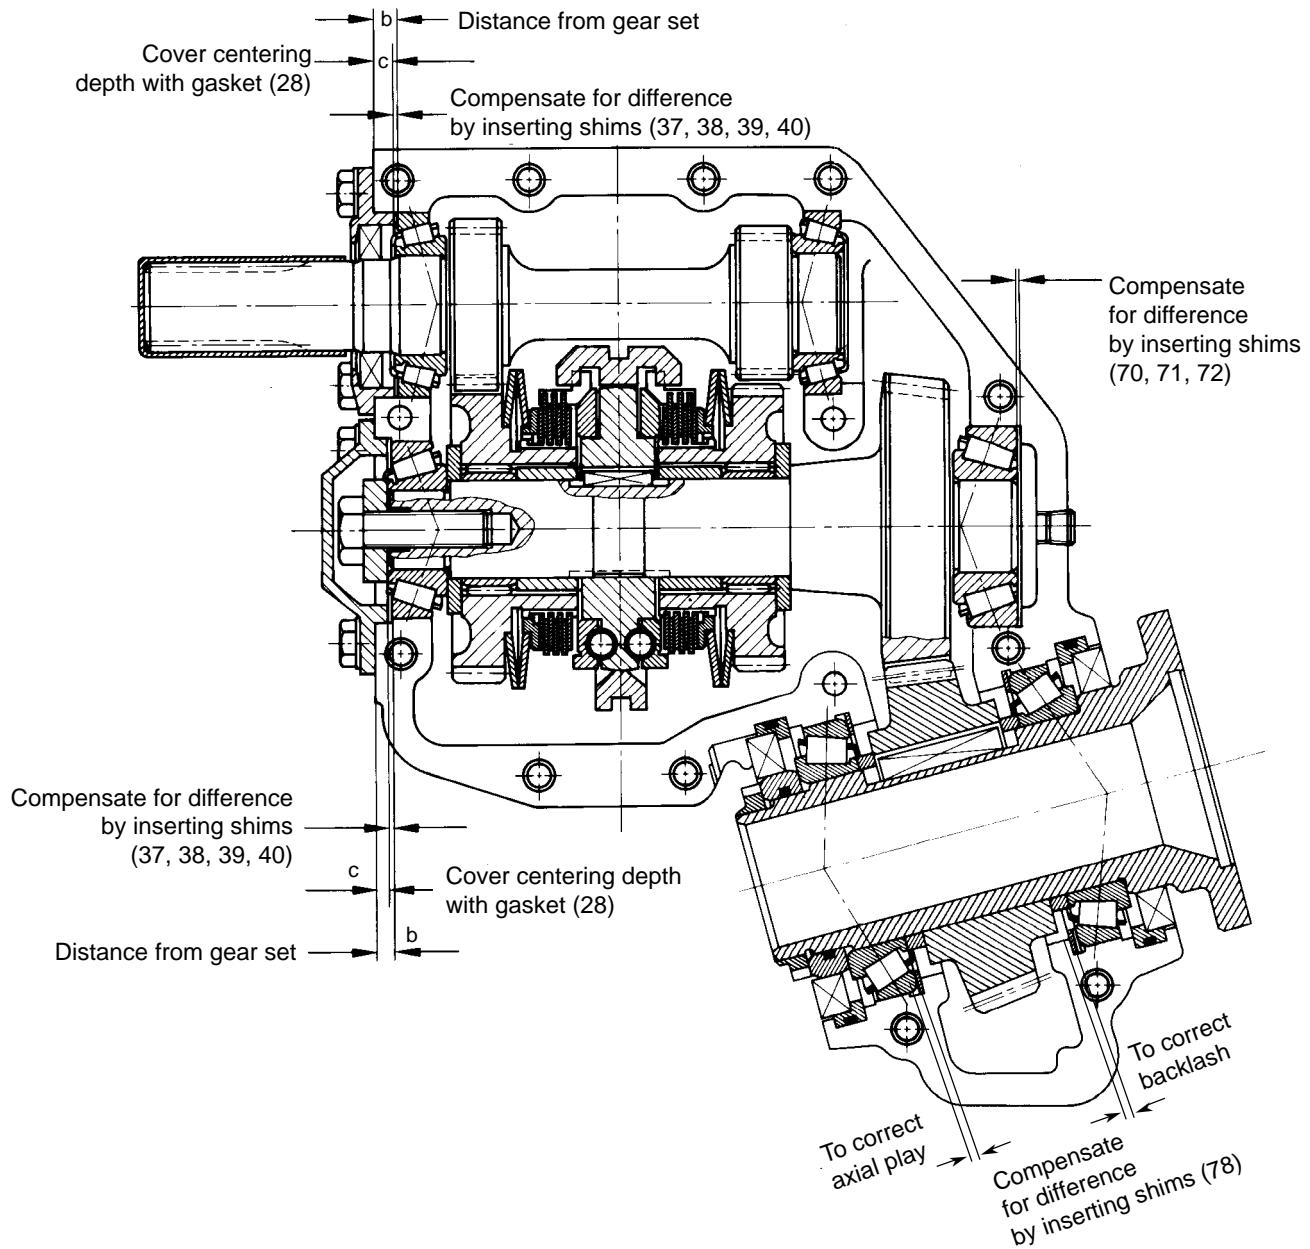

Fig. 36

6.13.3 Measure dimension «c» on cover (3) with gasket (28) installed, using a depth gauge (see illustration). The difference between the two dimensions indicates the distance to be filled up with shims (37, 38, 39, 40). Shims are available in thicknesses of 0.1 - 0.15-02.-03. and 0.5 mm.

On ZF 15 MIV, a hole is provided on the output side of the housing to permit this measuring operation: move shaft via gear (65) by means of a lever through opening in gearbox (see illustration next page).

Fig. 37

6.13.4 Insert the required number of shims into the bearing bores of the gearbox to obtain an axial clearance of the output and input shafts of 0.05 ± 0.02 mm.

If no parts had to be replaced (see item 5.4.4), the previously disassembled shims (37, 38, 39, 40) can be re-used in the previous arrangement and positions. It will be advisable, however, to check the bearing clearance and correct it if required.

6.13.5 Mount the previously measured covers (3) on the output and input shafts by means of spring washers (4) and screws (5), using a 13 mm spanner (wrench). Tighten to torque of 14 Nm (10 ft lb).

6.13.6 Place spring washers (4) underneath all screws (21) and tighten screws to a torque of 22 Nm (16 ft lb), using a 13 mm spanner (wrench).

6.13.7 Tap output and input shafts lightly in an axial direction while rotating the shafts, to ensure freedom of movement.

6.13.8 Axial clearance of input and output shafts: 0.05 ± 0.02 mm, measured by means of dial indicator in contact with end face of shaft (see illustration).

6.13.9 Measure axial clearance of quill shaft (on ZF 15 MIV), also with dial indicator in contact with end face of the shaft (see illustration).

Permissible clearance: 0.05 ± 0.02 mm.

0.05 ± 0.02 mm
0.002 ± 0.0008 in

Fig. 38

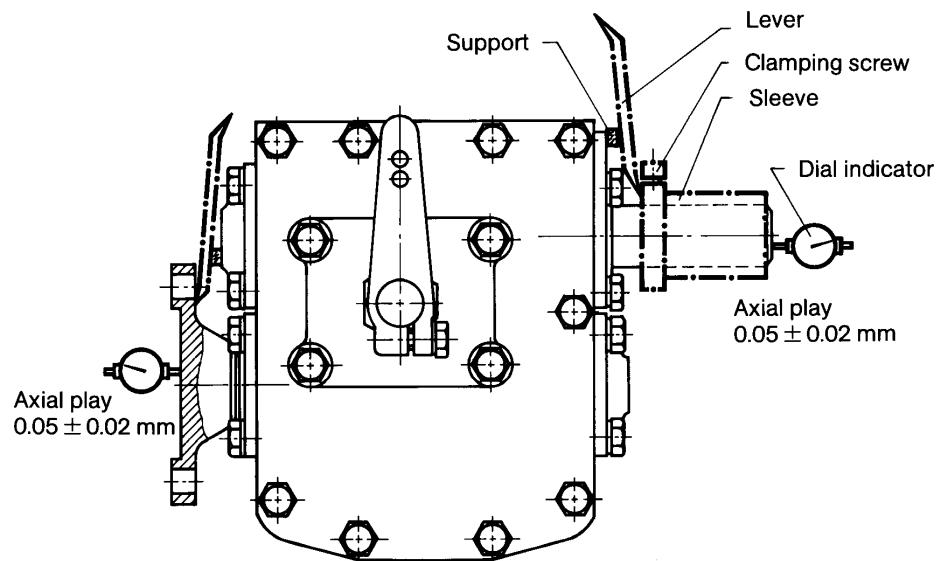

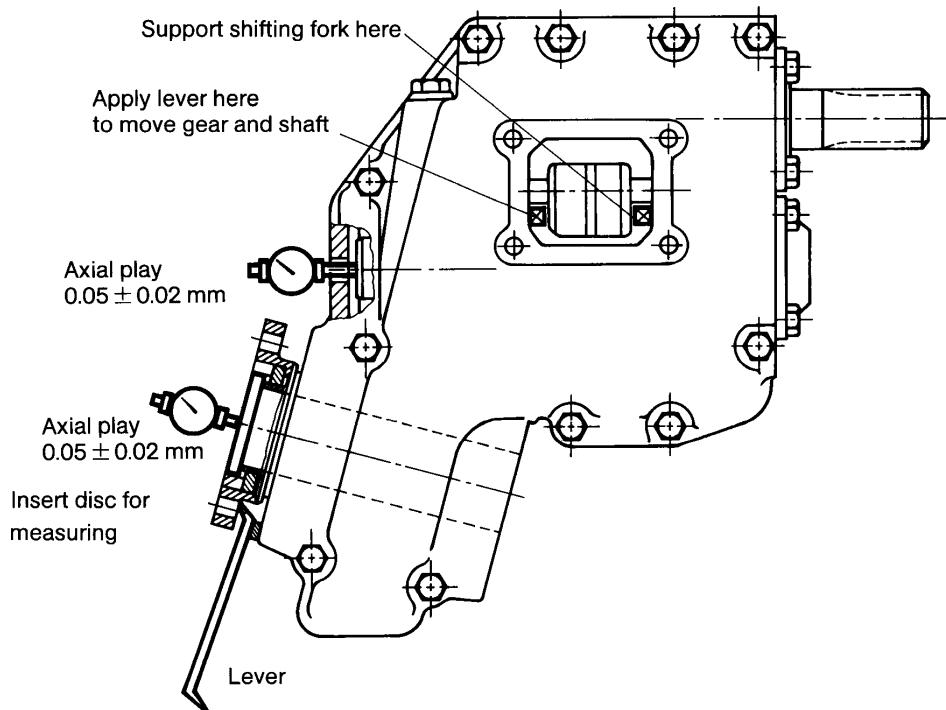

Fig. 39

6.14 Mounting the actuating lever cover plate

6.14.1 Place gasket (29) or Loctite 574 on pre-assembled cover plate and fit it to gearbox. Watch for proper engagement of actuating cam and shifting fork. The cover plate can be mounted when the shifting fork is in the middle (=neutral) position. It is important to adjust the actuating lever to exactly midway position in neutral.

Screw the cover plate in place in this position.

The lever travel from 0 to A and from 0 to B should be equal. After a lever travel of 28 to 31 mm (1.10 to 1.22 in) the transmission should be in gear.

If the lever travel from «0» to «A» and from «0» to «B» is not equal adjust cover position by light hammer blows on the cover up to reach the equal travels. Fit spring washer (4) and screw nuts (22). Tighten to a torque of 20 Nm (15 ft lb). If studs (69) need to be replaced, fit them with Loctite 270 on the housing.

6.14.2 Fit spring washers (4) and screws (5), using a 13 mm spanner (wrench). Tighten to a torque of 14 Nm (10 ft lb). Check actuating lever for proper operation.

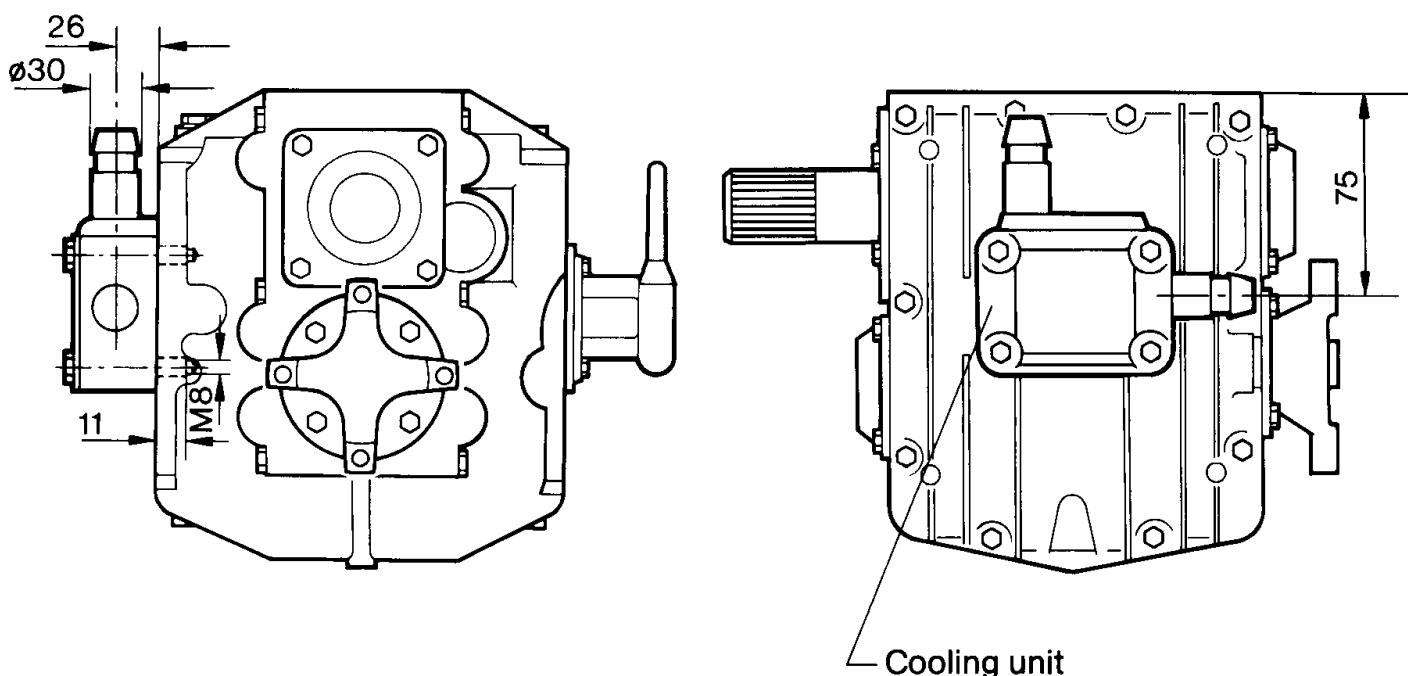

6.14.3 Fit oil drain plug (20) with sealing ring (18) and oil dipstick (19) with sealing ring (18).

Tighten to a torque of 20 Nm (15 ft lb).

6.15 Mounting the cooling unit (if provided)

6.15.1 Attach the cooling unit on the side opposite the cover plate (9). By means of 4 screws M8x65 and washers (available on kit pag. 23 item 1.2.10).

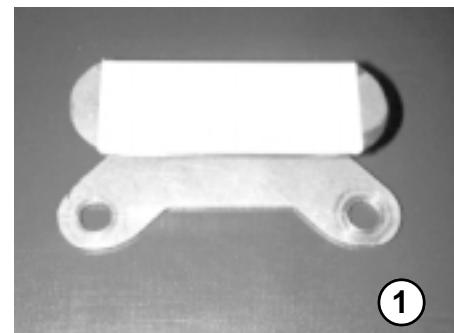

Fig. 40

7. Procedure to adjust the shifting lever cover

New bracket p/n 20.4039.02 to adjust the shifting lever cover (see picture 1).

- A) Before mounting the cover clean the mating surfaces and adjust the shifting fork to the neutral position.

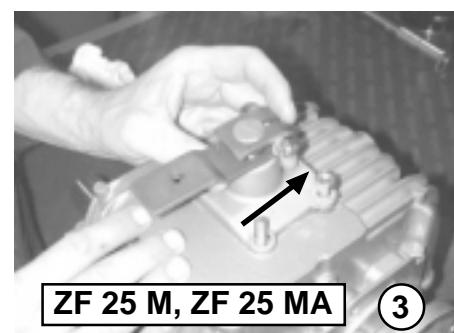

- B) Apply Loctite 574 (or alternatively 518) on the cover surface and position it with the lever in neutral (see picture 2).

Only for ZF 25 M, 25 MA: Push towards the bottom (see picture 3).

- C) Lightly tighten the four nuts.

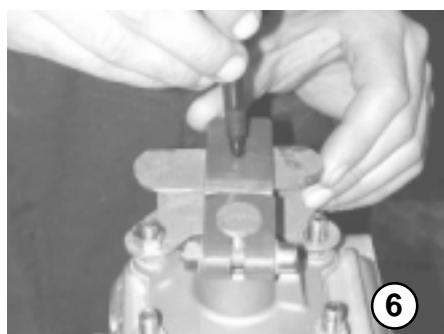

- D) Adjust the cover roughly in the middle.

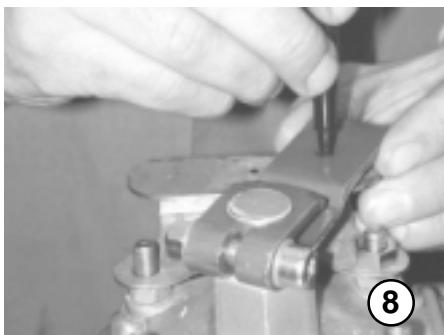

- E) Fit the adjusting bracket p/n 20.4039.02 using only one nut lightly tighten: the cover must be free to move with light hammer taps (see picture 4).

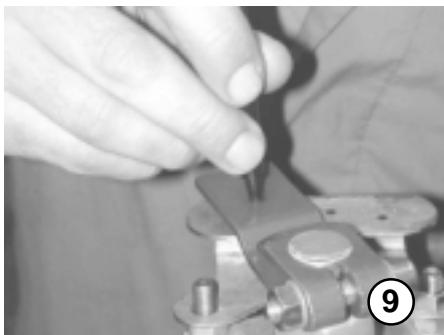

If the shifting lever in neutral has been rotated from the original vertical position apply on the adjusting bracket the suitable extension section P/N 20.4039.03 (see picture 5).

- F) Move the lever toward the detent A without engaging the clutch and mark the position; repeat the same for the detent B. If the shifting lever has two holes refer to the inner hole (see picture 6 and 7).

- G) Engage the clutch, turn back the lever to the engaging point and mark the position; repeat the same procedure for the other clutch (see picture 8 and 9).

- H) Consider the centre line between the internal marks and measure the distance from this line and the centre of the external marks (see picture 10 and 11).

The maximum allowed distance between the centre line and the external marks must be 24 mm.

The maximum difference between the two measurements must be less than 3 mm.

A must always be < 24 mm

B must always be < 24 mm

A – B < 3 mm

EX.:

A = 20 mm, B = 24 mm

A – B = 4 mm > 3 mm **NOT ALLOWED**

A = 21 mm, B = 23 mm

A – B = 2 mm < 3 mm **OK**

If the above conditions are not reached, move the cover toward the opposite direction where the measurement is largest by light hammer taps and repeat the marking operation.

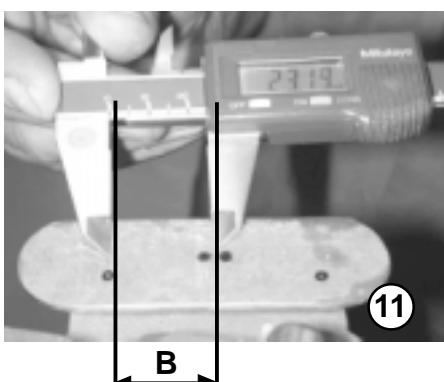

If it is not possible to adjust the cover to maximum 24 mm, the gearbox needs to be exchanged.

- I) After the correct adjusting measurement is reached tighten the four nuts with 22 Nm (16 lb.ft) torque.

- 6) Connect the shifting cable to the inner hole (if two holes) of the lever. Adjust the neutral position of the cable by the middle of the play of the lever in neutral.

The control cable should be perpendicular to the actuating lever in neutral position of the lever.

- 7) Make sure that the way of the control cable is enough long to move the inner hole of the lever at least 30 mm.

A

B

8. Troubleshooting

Possible Troubles and Remedies			
Kind of trouble	Noticeable effect	Possible cause	Remedy
Delay of gear engagement	Propeller will start rotating with several seconds delay or only after increase in engine speed.	<p>Lever travel 0-A not equal to lever travel 0-B.</p> <p>Insufficient clearance between actuating lever and cover plate (9).</p> <p>Shift cable fails to move lever through required min. travel 0-A=0-B = 35 mm/30 mm (1.37 in/1.18 in).</p>	<p>Detach shift cable and operate gearbox by hand to find whether malfunctions is caused by gear box or cable.</p> <p>If caused by transmission:</p> <p>Adjust cover plate (9) until lever is exactly in midway position. Travel 0-A = 0-B = 35 mm/30 mm 1.37 in/1.18 in</p> <p>Adjust to min. clearance of 0.5 mm (0.02 in).</p> <p>If caused by shift cable:</p> <p>Check total travel of shift cable. If too short, adjust accordingly.</p>
Transmission fails to move in gear	Excessive effort required to move actuating lever.	<p>Insufficient clearance between actuating lever and cover plate (9).</p> <p>Guide sheaves for shift cable unsuitably positioned: radius too small.</p>	<p>Detach shift cable and operate lever by hand. If lever jams, adjust clearance to 0.5 mm (0.02 in).</p> <p>Check and adjust accordingly.</p>
Boat fails to attain top speed specified	Increased operating temperature.	<p>Use of wrong oil.</p> <p>Boat operated without cooling unit.</p> <p>Transmission operating in upper limit range.</p>	<p>Use ATF oil and check oil level.</p> <p>Install cooling unit.</p> <p>Use suitable ZF M transmission unit.</p>
Oil leakage	Oil leakage visible on transmission unit.	<p>Corrosion effects in area of radial sealing ring and shaft; damaged radial sealing rings.</p> <p>Improper installation of seal.</p> <p>Misalignment of output flanges.</p>	<p>Check and correct oil level.</p> <p>Remove and dismantle transmission remachine shafts, replace radial sealing rings</p> <p>Check alignment to be within 0.08 mm (0.003 in) radially.</p>

9. Spare Parts List

Preface

The spare parts list is only valid for the type and versions of transmission, as shown below.

You will find the transmission type and version on your transmission name plate.

If the type and version indicated differs from that printed in this Manual, the relative Spare Parts List should be ordered from ZF -HURTH Marine.

The indicated dimensions and standards are as such not enough for ordering parts.

When ordering parts, please state:

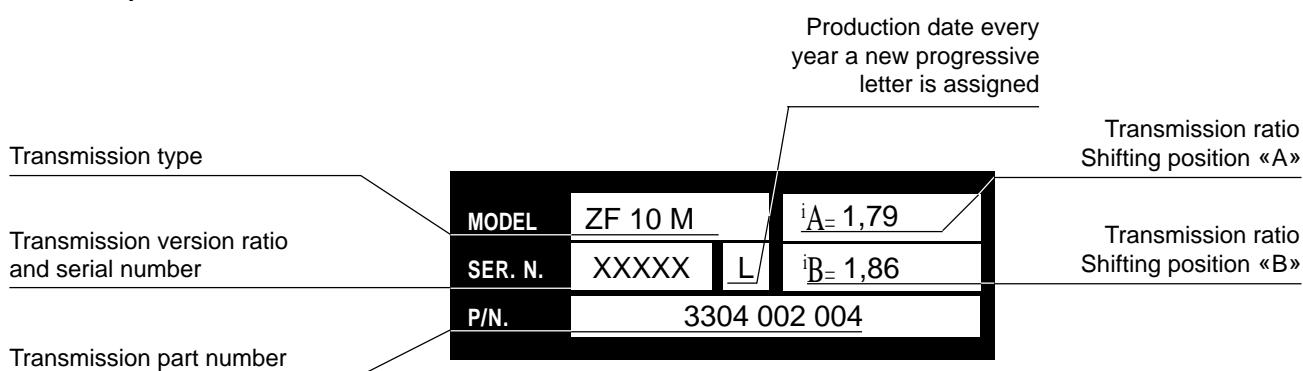

- transmission type
- serial number
- item no. part name, ident no. and quantity of parts required.

The spare parts list is referring to the following versions:

ZF 3 M	versions 001; 002	HBW 35	versions 25; 26;
ZF 5 M	versions 001; 002	HBW 50	versions 09; 10; 11; 12; 14
ZF 10 M	versions 003; 004; 005; 010	HBW 100	versions 14; 15; 16; 17; 20; 21
ZF 12 M	versions 001; 002	HBW 125/HBW 10	versions 15; 16
ZF 15 M	versions 003; 004	HBW 150	versions 18, 17; 20; 22
ZF 15 MA	versions 003; 004; 005	HBW 150 A	versions 01; 02
ZF 15 MIV	versions 001; 002; 003	HBW 150 V	versions 08; 09; 10; 11
ZF 25 M	versions 001; 002; 007	HBW 250	versions 13; 16; 17; 18; 19; 20; 22; 23
ZF 25 MA	versions 005; 006		
ZF 30 M	versions 001; 002		

Name Plate

The name plate is mounted to the transmission
